

What happens when the two sentences are swapped

A How often the answer changes

○ = the identical question asked a second time

B What those changes do to accuracy

right → wrong

wrong → right

PAWS-X, 100 questions per cell. Swapping sentence1 and sentence2 leaves paraphrase equivalence unchanged, so a changed answer is an inconsistency. The hollow marker is Jev answering the identical question a second time, which bounds ordinary service variation. Luna returns no probability, so it has no such control.
